Subject: Volatility statement for Phaser 6120 series color printers

Phaser 6120 series printers do not retain any latent user image in the mechanical system of the printer during normal operation. If a print job is disrupted prior to completion a latent image may exist in the mechanical systems of the printer; the image may be removed by cycling power or printing a page.

Phaser 6120 series printers do not retain any latent image in the print controller (raster image processor) or associated RAM following the completion of printing. No user data is maintained in the print controller or associated RAM following the cycling of power.

Phaser 6120 series printers contain non-volatile flash memory contained on the controller. This memory does not retain any variable printing data, but can be used to retain software updates, store fonts, etc.. No user information is retained in this memory.

Phaser 6120 series printers equipped with hard disk drives will retain latent images in the hard disk only when the job retention features are enabled / utilized (Secure print, proof print, or saved print or job accounting).

Memory types for the Phaser 6120 series printers are:

The chart below shows the corresponding memory types for the Xerox Phaser 6120 printer. Please note there are no remnants of customer print data retained in the printer when both the (i) hard disk drive is removed (from printers with hard drives) and (ii) the power is turned off.

Model Number	Memory Type	Volatility	User Data
6120/N	SDRAM	Volatile	Yes ¹
	EEPROM	Non-Volatile	No ²
	Flash / ROM	Non-Volatile	No ³
	Hard Disk (Optional)	Non-Volatile	Yes ⁴

1 SDRAM memory can be upgraded to 640MB for all models.

2 Contains printer configuration and operational parameters. It does not contain user print data.

3 Is used for firmware code and contains no user print data.

4 Optional hard drive may contain user print data.
